

Predicted genetic drift intensity across five independent bottleneck lineages of *Lepidium papilliferum*

C3 Hypothesis — Stage 4 | 39 locations in 5 BLs | Panels ordered by within-BL connectivity (top row: connected; bottom row: isolated) | Fill = drift index (red = strong drift; blue = weak drift) | Node size = population size | ♦ connected • isolated
Colored solid: ≤500 m (connected, pollinator range) — Grey solid: >500 m to ≤2 km (near-miss, no gene flow) — Dashed + label: shortest distance >2 km between disconnected groups within BL
